

GrievX

Problem Statement:

GrievX -> AI-Powered Public Grievance Resolution System

In Tamil Nadu, everyday public problems such as broken roads, water shortages, drainage issues, garbage overflow, and power cuts remain unresolved for months or years because citizens do not know whom to contact, complaints are not properly tracked, and there is no structured escalation mechanism when authorities fail to respond. Existing government portals require English literacy and technical knowledge, making them inaccessible to most rural citizens.

GrievX is a Tamil-first, AI-powered public grievance platform that allows any citizen to report issues within 30 seconds using text, voice, photo, or video without any technical knowledge. The system automatically classifies the problem, identifies the responsible authority, and routes the complaint through the official government hierarchy:

Citizen → Ward Member / Councillor → Panchayat President → Government Officer → MLA → District Collector → Department Minister → Chief Minister / CM Cell

"If an authority fails to resolve the issue within the assigned deadline, the complaint is automatically escalated to the next higher authority -> until action is taken."

All complaint data is analyzed using AI/ML and visualized through a real-time analytics dashboard, giving government officers and district collectors clear insights into unresolved problems, officer performance, and high-priority zones. Citizens can verify resolution with a simple Yes/No confirmation, and all accountability records are stored publicly, so people know who solved their problems and who ignored them.

GrievX ensures continuous tracking, faster grievance resolution, full transparency, and data-driven accountability at every level of Tamil Nadu governance.
